Image quality check (IQ-01) - proof report

PClaimAssist research tests, Objective 3 (iii), rule IQ-01 - REAL scans, results of 2026-11-05 18:45:31, report generated 2026-11-05

Result. On 20 real logbook pages - the 10 handwriting spreads with 10 pages deliberately made dark, bright or blurred - IQ-01 warned on **10 of the 10 bad pages** and on 0 of the 10 normal pages. The 40 original logbook pages all pass. A dim, washed-out or too-dark page is evened out before it is read. Read with the OCR, the change in characters read right against the original scan was: normal -1.5; dark -12.2; bright -13.9; blurred -10.5 points.

Real scans, not generated. These pages were made bad by hand and scanned. The computer-generated copies are used only as an extra check that was not used to choose the thresholds (section 1). Four of the given labels were corrected after comparing each page with the original scan (section 3). **The thresholds were chosen from these pages and the 40 original pages**, so this shows they work on what they were set on; the generated copies and more real scans are the fair test.

Contents

1. Result at a glance
2. How IQ-01 checks a page
3. How the test works, and the labels
4. Every bad page: original, bad page, evened out
5. The values and the thresholds
6. What a bad page costs the OCR
7. What this means
Appendix A - every page, whole

The PDF also has bookmarks, and every page links back to these contents.

1. Result at a glance

Warning vs expected condition

	Expected: warn (bright/dark/blurred)	Expected: pass (normal)
Warning fired	10	0
No warning	0	10
Detection rate (bad pages warned)	1.0	
False warning rate (normal pages warned)		0.0

Per condition

Expected condition	Pages	Warning fired	Matched	Matched %
normal	10	0	10	100.0
dark	5	5	5	100.0
bright	3	3	3	100.0
blurred	2	2	2	100.0

Pages not made for this test

Pages	Should	Pages checked	Warning fired
Original handwriting pages - scanner	pass	20	0
Original handwriting pages - phone	pass	20	0
GENERATED dark copies (iq_check --generate)	warn	20	20
GENERATED bright copies (iq_check --generate)	warn	20	20
GENERATED blurry copies (iq_check --generate)	warn	20	20

The original handwriting pages should pass; the generated copies were not used to choose the thresholds.

2. How IQ-01 checks a page

The Logbook Reader checks every page with image_quality.assess_logbook_page before reading it. It measures the page's **brightness** (mean grey level, 0-255), its **sharpness** (variance of the Laplacian, on the page scaled to 1000 px wide so it does not depend on the scan's resolution), how much of it is **pure white**, and how dark the **writing** is (the darkest 0.1% of pixels). It warns when:

Warning	When	Good logbook pages measured
Too dark	brightness below 60	-
Dim page	brightness below 220	230.4 or more
Too bright	brightness above 200 and the writing lighter than 150	-
Washed out	at least 50% of the page pure white and the writing at 100 or lighter	bleached pages with dark writing (phone scans): 1-86
Blurry	sharpness (full size) below 100	-
Soft focus	sharpness at 1000 px wide below 200	346 or more

The warning asks staff to rescan. A **dim, washed-out or too-dark** page is also **evened out** before its rows and cells are found and read (image_quality.enhance_for_ocr): its paper is set back to white and its ink to dark. A blurred page is only warned about. The thresholds and the evening-out switch are in config.py (OCR_IMAGE_QUALITY_...).

3. How the test works, and the labels

Each page is loaded the way the Logbook Reader loads it (PDF at 2x, straightened) and checked with IQ-01. The warning should fire on the dark, bright and blurred pages and stay quiet on the normal ones. Each page was also compared with the same page of the original scanner scan: an untouched page changes by about -1 in brightness and +3 to +10 in ink level (it was only re-saved), so a real change stands out. Four labels did not match what had been done to the page and were corrected (inputs/iq_expected.csv keeps both):

File	Page	Label given	Used	Evidence
W03_caps_iq.pdf	1	normal/ bright	bright	mean brightness 233.8 -> 246.4; ink 67 -> 121 (fainter) - the same change as W01 p2
W04_caps_iq.pdf	2	bright	dark	CORRECTED: the page got darker, not brighter - mean brightness 236.0 -> 202.1 (grey paper), ink unchanged (50 -> 49)
W05_caps_iq.pdf	2	normal	bright	CORRECTED: brightened like W01 p2 - mean brightness 235.7 -> 247.3, ink 67 -> 104 (fainter), sharpness halved
W07_lower_iq.pdf	2	normal	dark	CORRECTED: darkened - mean brightness 237.1 -> 211.1, ink 89 -> 22

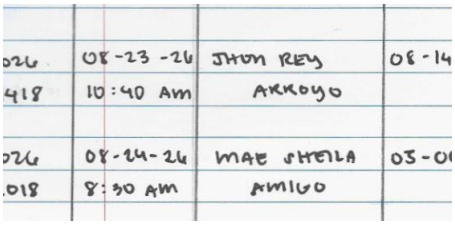

4. Every bad page: original, bad page, evened out

Left to right: the original scanner scan, the IQ test page, and - for a page that is evened out - the copy the OCR reads. Top: a close-up of the same spot; below: the whole page.

5. The values and the thresholds

Pages IQ-01 gets wrong

None.

Where the values lie

Expected condition	Brightness (min - max)	Sharpness 1000 px (min - max)	Pure white % (min - max)	Darkest writing (min - max)
normal	232.54 - 246.17	346.10 - 1151.55	0.20 - 80.00	45.00 - 110.00
dark	128.03 - 211.09	385.03 - 1617.21	0.00 - 0.40	0.00 - 49.00
bright	246.40 - 247.59	242.49 - 344.21	78.80 - 85.40	104.00 - 121.00
blurred	231.91 - 232.29	58.19 - 152.40	0.30 - 0.50	0.00 - 127.00

Dim pages are told apart by brightness, soft ones by sharpness at a fixed size, washed-out ones by bleached paper together with faint writing (bleached paper alone is normal for phone-app scans). These thresholds were set on these pages and the 40 original pages; please confirm them on more scans.

6. What a bad page costs the OCR

Each IQ test scan was read with PaddleOCR + Correction (the value the system pre-fills), the way the Logbook Reader reads it - a flagged page evened out first - and each page scored against the answer key exactly as in the handwriting test, beside the same page of the original scan. The writing is the same, so the difference is the page.

Expected condition	Pages	Evened out	Characters % original	Characters % IQ page	Change (pp)	Exact % original	Exact % IQ page
normal	10	0	58.5	57.02	-1.49	4.2	3.43
dark	5	5	65.13	52.89	-12.24	3.63	2.9
bright	3	3	63.5	49.63	-13.87	8.23	8.48
blurred	2	0	41.64	31.18	-10.46	0.0	0.0

File	Page	Expected condition	Warning fired	Evened out	Characters % original	Characters % IQ page	Change (pp)
W01_caps_iq.pdf	1	dark	Yes	Yes	74.97	73.67	-1.3
W01_caps_iq.pdf	2	bright	Yes	Yes	68.92	24.25	-44.67
W02_caps_iq.pdf	1	normal	No	No	68.1	67.14	-0.96

W04_caps_iq.pdf	1	normal	No	No	79.95	74.12	-5.83
W04_caps_iq.pdf	2	dark	Yes	Yes	66.27	29.68	-36.59
W05_caps_iq.pdf	1	normal	No	No	61.32	58.26	-3.06
W05_caps_iq.pdf	2	bright	Yes	Yes	36.1	35.53	-0.57
W06_lower_iq.pdf	1	normal	No	No	59.75	61.69	1.94
W06_lower_iq.pdf	2	dark	Yes	Yes	56.07	49.66	-6.41
W07_lower_iq.pdf	1	normal	No	No	47.32	46.86	-0.46
W07_lower_iq.pdf	2	dark	Yes	Yes	43.31	32.6	-10.71
W08_lower_iq.pdf	1	normal	No	No	63.48	63.27	-0.21
W08_lower_iq.pdf	2	normal	No	No	29.64	30.81	1.17
W09_lower_iq.pdf	1	blurred	Yes	No	54.47	52.79	-1.68
W09_lower_iq.pdf	2	blurred	Yes	No	28.82	9.57	-19.25
W10_lower_iq.pdf	1	normal	No	No	70.25	67.69	-2.56
W10_lower_iq.pdf	2	normal	No	No	31.17	32.4	1.23

7. What this means

IQ-01 catches the bad pages. It warned on 10 of the 10 pages made dark, bright or blurred on purpose, with 0 false warnings on the 10 normal pages; it lets the 40 original logbook pages through and catches the generated bad copies it was not set on. Staff are told to rescan these pages.

A rescan matters. Even read the way the system reads them (dim and washed-out pages evened out first), the bad pages read worse than the original scan of the same writing - by dark 12.2, bright 13.9, blurred 10.5 points of character accuracy on average, against 1.5 for a normal page scanned again (section 6). That is why the warning asks staff to rescan.

Appendix A - every page, whole
