Correction module - proof report

PClaimAssist research tests, Objective 3 (i), Eq. 3.2-3.4 - results of 2026-11-04 22:50:08, report generated 2026-11-05

Result. On the scanner scans the correction module changed **294** of PaddleOCR's 909 readings. **7** of those changes produced the correct value and **3** turned a correct reading wrong: correction precision **0.0238** (Eq. 3.3), harmful correction rate **0.0102** (Eq. 3.4). Exact matches went up by 0.44 percentage points and character accuracy by 0.88 (Eq. 3.2). Most changes leave the reading wrong but different: 182 brought it closer to what is written, 36 moved it further away. Phone photos: 250 changes, precision 0.008, harmful rate 0.0.

1. Result at a glance

Source	Engine	Cells	Exact % raw	Exact % corrected	Exact improvement (pp, Eq. 3.2)	Character accuracy improvement (pp, Eq. 3.2)	Changes made	Correction precision (Eq. 3.3)	Harmful correction rate (Eq. 3.4)
Handwriting test (phone)	PaddleOCR	825	0.85	1.09	0.24	1.26	250	0.008	0.0
Handwriting test (phone)	TesseractOCR	825	0.36	0.36	0.0	2.39	373	0.0	0.0
Handwriting test (scanner)	PaddleOCR	909	4.18	4.62	0.44	0.88	294	0.0238	0.0102
Handwriting test (scanner)	TesseractOCR	909	0.66	0.77	0.11	4.68	434	0.0046	0.0023
All sources	PaddleOCR	1734	2.6	2.94	0.34	1.06	544	0.0165	0.0055
All sources	TesseractOCR	1734	0.52	0.58	0.06	3.59	807	0.0025	0.0012

What each change did

Scan	Engine	Cells	Changes	Helpful	Harmful	Closer	Further	No difference
scanner	PaddleOCR	909	294	7	3	182	36	66
scanner	TesseractOCR	909	434	2	1	299	7	125
phone	PaddleOCR	825	250	2	0	126	27	95
phone	TesseractOCR	825	373	0	0	181	4	188

The changes pictured here are exactly the ones the test counted (checked: the counts match).

2. How the test works and how to read the pictures

For every handwritten cell the OCR read (handwriting test, rows the system found, cells with writing), the reading straight from the engine (*raw*) is compared with the reading after the Logbook Reader's correction module (*corrected*): the AI second look on unsure cells (a re-read of an enhanced picture), known fixes, place names and capitals. Both are scored against what the writer wrote.

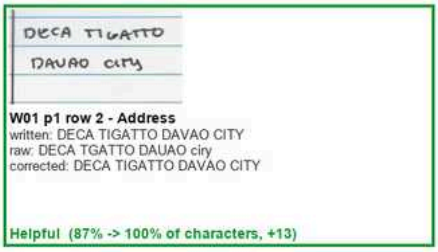

Eq. 3.2 accuracy improvement = corrected minus raw, in percentage points. **Eq. 3.3** correction precision = changes that produced the correct value / all changes. **Eq. 3.4** harmful correction rate = correct raw values made incorrect / all changes. A change = the corrected reading differs from the raw one, capitals and spaces aside.

The pictures. Each card is one change: the cell as the OCR saw it, what is written, the raw and the corrected reading, and the share of characters right before and after. Frame: **green** helpful, **red** harmful, **blue** closer, **orange** further, grey no difference.

3. Every helpful change (wrong before, exactly right after)

4. Every harmful change (right before, wrong after)

PaddleOCR, scanner: 3

Harmful changes - PaddleOCR, scanner (3)

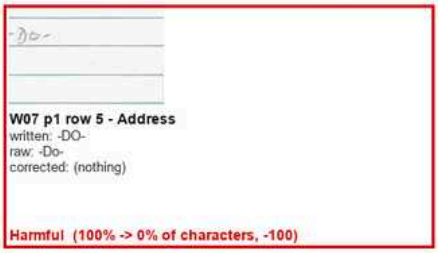

TesseractOCR, scanner: 1

Harmful changes - TesseractOCR, scanner (1)

All harmful changes are ditto marks. Each is an Address where the writer wrote "-DO-" (same as the row above), the OCR read it right, and the "corrected" value is empty. That is by design: the Logbook Reader treats a cell holding only a ditto mark as "nothing to type" (logbook_pipeline.field_status), and case_bridge replaces a "-DO-" address with the address of the patient above. So these are counted as harmful by Eq. 3.4, but no reading was damaged. Worth confirming with the team that the address above is filled in when the review marks a ditto cell as empty.

5. Per category

Source	Field	Cells	Exact improvement (pp, Eq. 3.2)	Character accuracy improvement (pp, Eq. 3.2)	Changes made	Changes that produced the correct value	Correct raw values made incorrect

PaddleOCR (the engine the system uses). Both engines are in correction_metrics_results.xlsx, sheet 2b.

6. Cells with nothing written

Source	Blank cells	PaddleOCR false readings	PaddleOCR false readings %	PaddleOCR + Correction false readings	PaddleOCR + Correction false readings %

Handwriting test (phone)	73	37	50.68	38	52.05
Handwriting test (scanner)	81	31	38.27	33	40.74
All sources	154	68	44.16	71	46.1

A false reading = something read where nothing is written. Left out of every figure above, as in the test.

7. What this means

The correction module is safe but does little on handwriting. It rarely breaks a correct reading (3 of 294 changes on the scanner) and fixes a few completely (7), so exact matches rise only 0.44 points. Its effect is mostly small: 182 changes bring a reading closer to what is written and 36 move it further, for a net 0.88 points of character accuracy. It cannot repair a reading that is far off - and many are, because handwriting is hard to read and some cells were cut badly (see the logbook cutting and OCR accuracy reports). Staff review remains where readings are made right.

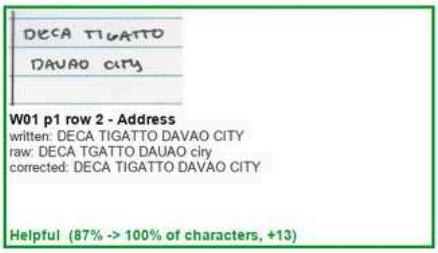

These results are for the correction model as it starts (the system's starter rows only). The supplementary held-out comparison (outputs/approved/supplementary/) shows the effect once it has learned from one corrected spread.
