OCR accuracy (handwriting test) - proof report

PClaimAssist research tests, Objective 3 (i), Eq. 3.1 - results of 2026-11-04 22:43:21, report generated 2026-11-05

Result. On the 10 writers' logbook pages (scanner, 909 cells with writing), the value the system pre-fills - **PaddleOCR + Correction** - is **exactly right in 4.62%** of cells, with **60.67% of characters right** on average; 29.37% of cells have at least 80% of their characters right. Tesseract on the same cells: 0.77% exact, 33.36% of characters. Phone photos: 1.09% exact, 38.47% of characters.

Cutting matters. On scanner cells that were cut properly (logbook cutting test), PaddleOCR + Correction gets 67.32% of characters right (5.52% exact, 743 cells); on cells cut badly, 30.91% (0.6% exact, 166 cells).

2. How the test works and how to read the pictures

Ten people each wrote 11 fictional patients into a real logbook layout (W01-W05 in capitals, W06-W10 in lower case). Each spread was scanned with a flatbed scanner and photographed with a phone. The Logbook Reader found the rows, cut each into its cells, and PaddleOCR read every cell; its correction step (the AI second look and the known-value lists) gives the value staff see. Tesseract read the very same cell pictures for comparison. Every cell is compared with what the writer actually wrote (the answer key).

The pictures (appendices): for each logbook row, the row as found on the scan, then each cell picture with what is written and the four readings. The frame is the value the system pre-fills (PaddleOCR + Correction): **green** = exact, **orange** = close (at least 80% of the characters right), **red** = wrong or row not found, grey = nothing written in the logbook (scored separately as false readings). A reading marked [exact] matched the answer key.

Exact match is strict: one wrong character - a missing hyphen, "0" for "O" - makes the cell wrong. That is Eq. 3.1 and the main measure; character accuracy shows how close the readings are.

4. Where the errors come from

4.1 Cutting (from the logbook cutting test)

Scan	Cells	Cut	Exact %	Characters %
scanner	743	proper, right row	5.52	67.32

PaddleOCR + Correction. A cell that holds only part of its writing, or another row's, cannot be read right however good the OCR is.

5. What this means

The OCR does not read handwriting reliably enough to be used without review. Exactly right cells: 4.62% on the scanner, 1.09% on the phone. Most readings are close but not exact (60.67% of characters right on average on the scanner): useful as a starting point that staff correct, not as final values. That is how PClaimAssist uses them - every reading goes through the review page, and its confidence decides what is pre-filled - and why the review step is part of the design.

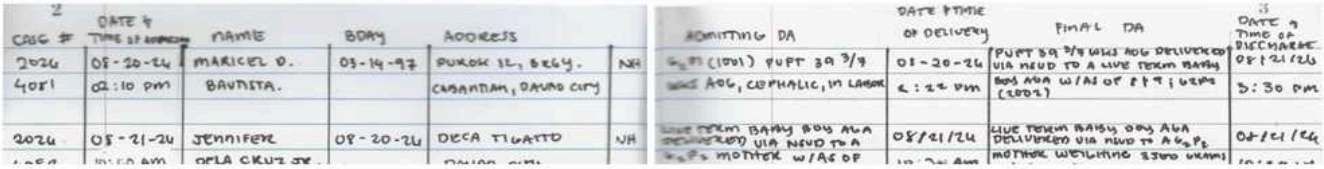

Scanner scans are clearly better than phone photos; capitals better than lower case (section 3); and part of the error is the cutting, not the reading (section 4.1).
